

Fragments of the Forest: Hot Zones, Disease Ecologies, and the Changing Landscape of Environment and Health in West Africa

Shadrach Kerwillain

I am a part of an interdisciplinary European Research Council-funded project, "Fragments of the Forest: Hot Zones, Disease Ecologies, and the Changing Landscape of Environment and Health in West Africa". The project explores the ecological, economic, political, and social forces at play that have turned fragments of the upper Guinean rainforest into hot zones of endangerment and considers the consequences for human and nonhuman inhabitants living in the region.
